Manufactured and sold by:

Kobold Messring GmbH
Nordring 22-24
D-65719 Hofheim
Tel.: +49(0)6192-2990
Fax: +49(0)6192-23398
E-Mail: info.de@kobold.com
Internet: www.kobold.com

2. Note

Please read these operating instructions before unpacking and putting the unit into operation. Follow the instructions precisely as described herein.

The instruction manuals on our website www.kobold.com are always for currently manufactured version of our products. Due to technical changes, the instruction manuals available online may not always correspond to the product version you have purchased. If you need an instruction manual that corresponds to the purchased product version, you can request it from us free of charge by email (info.de@kobold.com) in PDF format, specifying the relevant invoice number and serial number. If you wish, the operating instructions can also be sent to you by post in paper form against an applicable postage fee.

Operating instructions, data sheet, approvals and further information via the QR code on the device or via www.kobold.com

The devices are only to be used, maintained and serviced by persons familiar with these operating instructions and in accordance with local regulations applying to Health & Safety and prevention of accidents.

When used in machines, the measuring unit should be used only when the machines fulfil the EC machinery directive.

3. Instrument Inspection

Instruments are inspected before shipping and sent out in perfect condition.

Should damage to a device be visible, we recommend a thorough inspection of the delivery packaging. In case of damage, please inform your parcel service / forwarding agent immediately, since they are responsible for damages during transit.

Scope of delivery:

The standard delivery includes:

- Digital Indicator and Controller model: DAG-M3F

4. Regulation Use

Any use of the device, which exceeds the manufacturer's specification, may invalidate its warranty. Therefore, any resulting damage is not the responsibility of the manufacturer. The user assumes all risk for such usage.

5. Operating Principle

The panel meter **DAG-M3F** can evaluate pulses in many different ways and show the result in the 5-digit LED-display. Available options are: frequency coverage with optional filters, summate of pulses or display values via the time, detection of a rotational speed or collection of a position via an incremental encoder. The results can be monitored via alarm conditions and can be displayed onto the optional switching point.

Furthermore, the results can be freely scaled on an optional analog output and relayed to a control system. The device can be operated directly by Namur sensors, 3-wire sensors, switching/slider contacts, incremental encoders (HTL-/TTL-output) or TTL-signals.

Via the 3 navigation keys on the front, the device can be adjusted onto different kind of applications and later on different functions of the device can be controlled. With an individual code, the created parameterisation can be protected against changes of the user.

Numerous applications can be realised with this device, like e.g. tachometer, revolution counter, flowmeter, dosing equipment, filling capacity meter, baking time meter of a baking oven, flying knife, position evaluation, position surveillance, flow rate surveillance, acoustic discharge measurements and so on. By use of the integrated, configurable functions like permanent min/max-recording, averaging, frequency filter, setpoint setting, threshold value recording via alarm system, 30-points-linearisation, mathematic charging and many more, you receive an universal applicable modern instrument for your demands in measuring and control technique.

6. Assembly

Please read the *Safety advice* on *page 40* before installation and keep this user manual for future reference

1. After removing the fixing elements, insert the device.
2. Check the seal to make sure it fits securely.
3. Click the fixing elements back into place and tighten the clamping screws by hand. Then use a screwdriver to tighten them another half a turn.

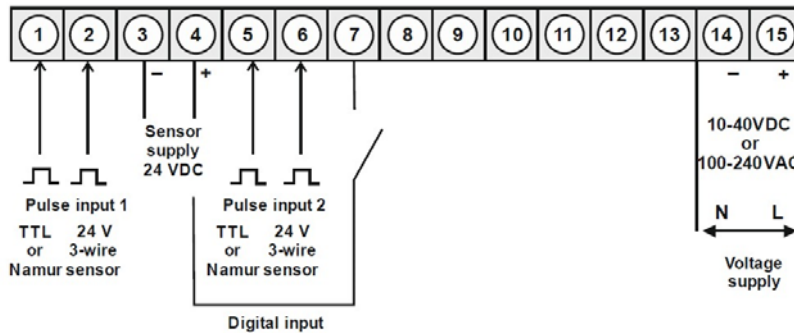

CAUTION! The torque should not exceed 0.1 Nm!

The dimension symbols can be exchanged before installation via a channel on the side!

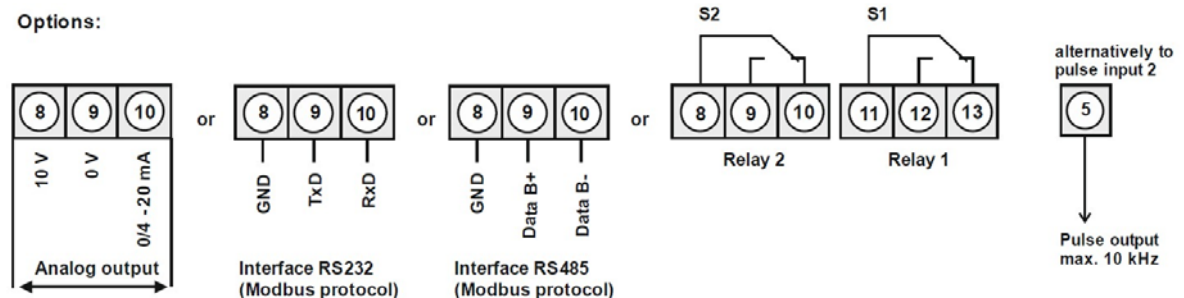

7. Electrical Connection

Type DAG-M3F80W0R supply 100-240 VAC 50/60Hz, DC $\pm 10\%$

Type DAG-M3F70W0R supply 10-40 VDC galv. isolated, 18-30 VAC 50/60Hz

Options:

Alternatively to analog output

Connection examples:

Namur

Namur

3-wire PNP

3-wire PNP

3-wire NPN

3-wire NPN

Connection examples:

Incremental encoder

Incremental encoder (max. 50 mA current consumption)

DAG-M3F with digital input in combination with a 24 VDC sensor supply

DAG-M3F with digital input and external voltage source

8. Function and operation description

Operation

The operation is divided into three different levels.

Menu level (delivery status)

The menu level is for the standard settings of the device. Only menu items which are sufficient to set the device into operation are displayed. To get into the professional level, run through the menu level and parameterise “**prof**” under menu item **RUN**.

Menu group level (complete function volume)

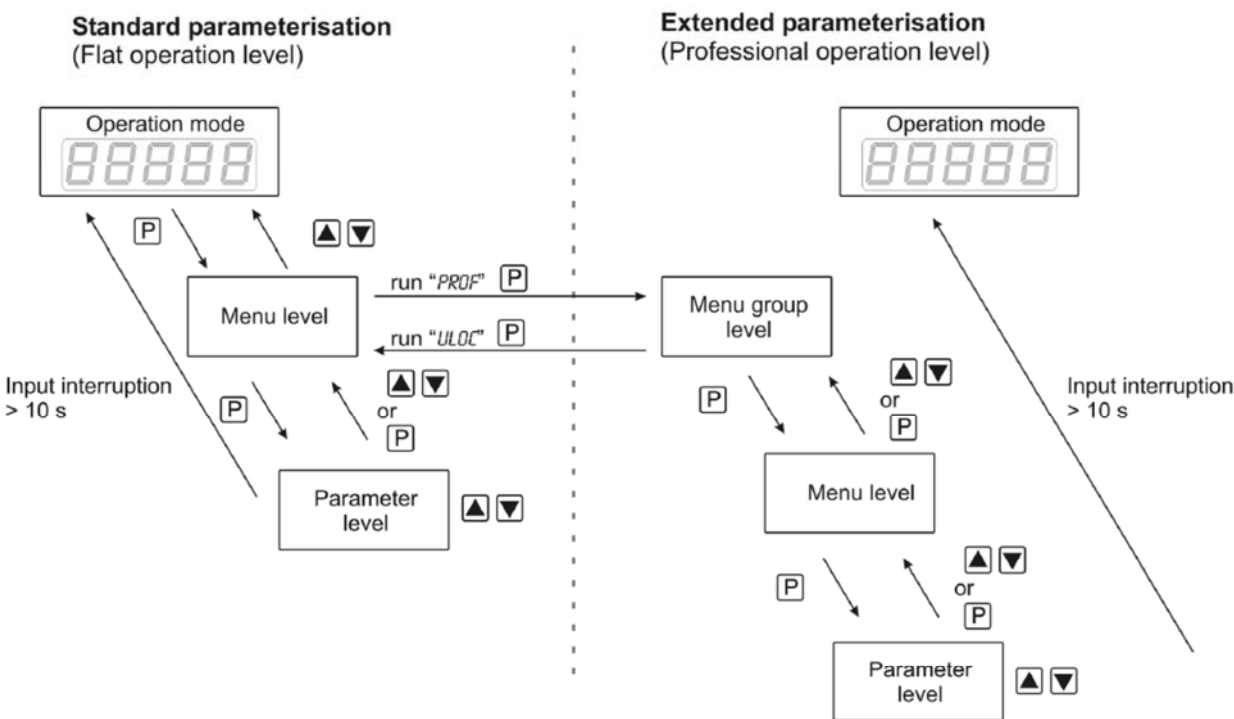

Suited for complex applications as e.g. linkage of alarms, setpoint treatment, totaliser function etc. In this level, function groups which allow an extended parameterisation of the standard settings are available. To leave the menu group level, run through this level and parameterise „**uloc**„ under menu item **RUN**.

Parameterisation level:

Parameter deposited in the menu item can here be parameterised. Functions, that can be changed or adjusted, are always signalled by a flashing of the display. Settings that are made in the parameterisation level are confirmed with **[P]** and thus saved. Pressing the **[O]**-key („zero-key“) leads to a break-off of the value input and to a change into the menu level. All adjustments are saved automatically by the device and it changes into operating mode, if no further key operation is done within the next 10 seconds.

Level	Key	Description
Menu level		Change to parameterisation level and deposited values.
	 	Keys for up and down navigation in the menu level.
	 	Change into operation mode by pushing both navigation keys at the same time.
Parameterisation level		To confirm the changes made at the parameterization level.
	 	Adjustment of the value / the setting.
	 	Change into menu level or stop of the value input, by pushing both navigation keys at the same time.
Menu group level		Change to menu level.
	 	Keys for up and down navigation in the menu group level.
	 	Change into operation mode or return into menu level, by pushing both navigation keys at the same time.

Function chart:

- Explanation:
- P** Take-over
 - ▲▼** Breakoff by simultaneously pushing of the navigation keys
 - ▲** Value selection (+)
 - ▼** Value selection (-)

9. Setting up the device

9.1 Switching-on

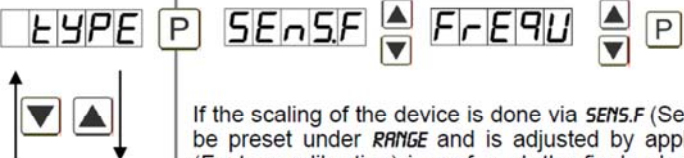

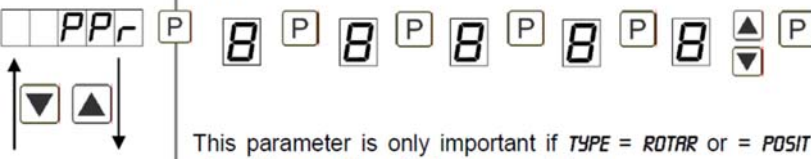

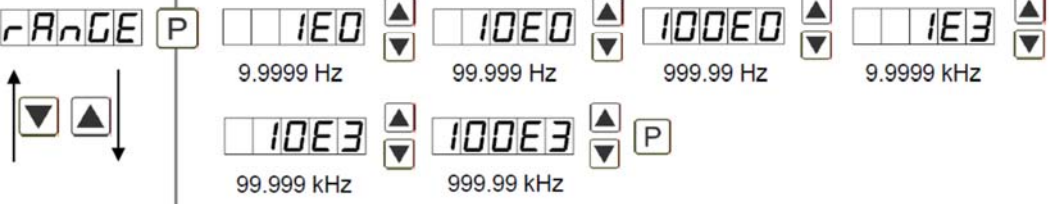

Once the installation is complete, start the device by applying the voltage supply. Before, check once again that all electrical connections are correct.

Starting sequence

For 1 second during the switching-on process, the segment test (8 8 8 8 8) is displayed, followed by an indication of the software type and, after that, also for 1 second, the software version. After the starting sequence, the device switches to operation/display mode.

9.2 Standard parameterisation: (flat operation level)

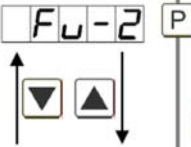

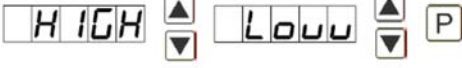

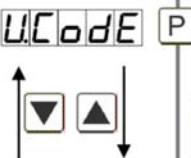

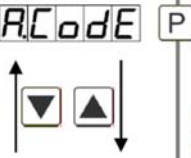

To parameterize the display, press the **[P]** key in operating mode for 1 second. The display then changes to the menu level with the first menu item **TYPE**.

Menu level	Parameterisation level
	<p>Selection of the input signal, TYPE: Default: <i>FREQU</i></p> <p>If the scaling of the device is done via <i>SENS.F</i> (Sensor calibration), the frequency range needs to be preset under <i>RANGE</i> and is adjusted by application of the final value/initial value. If <i>FREQU</i> (Factory calibration) is preferred, the final value needs to be entered under <i>END</i> and the final frequency needs to be entered under <i>OFFS</i>. Under <i>OFFS</i> the initial value needs to be entered and under <i>OFFSA</i> the initial frequency. There is no application of the measuring signal. Confirm the selection with [P] and the display switches back to menu level.</p>
	<p>Adjustment of pulses per rotation, PPR: Default: 1</p> <p>This parameter is only important if <i>TYPE</i> = <i>ROTAR</i> or = <i>POSIT</i> have been selected. Generally it shows the number of pulses per rotation.</p>
	<p>Setting end value of the measuring range, END: Default: <i>100E3</i></p> <p>Choose between six different frequency ranges. Confirm the selection with [P] and the display switches back to menu level.</p>

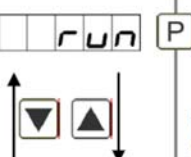

Menu level	Parameterisation level
	Setting the final value of the measuring range, <i>END</i>: Default: 10000
	<p>Set the final value from the smallest to the highest digit with [▲] [▼] and confirm each digit with [P]. A minus sign can only be parametrized on the leftmost digit. After the last digit, the display switches back to the menu level. If <i>SEMS</i> was selected as input option, you can only select between <i>NOCA</i> and <i>CAL</i>. With <i>NOCA</i>, only the previously set display value is taken over, and with <i>CAL</i>, the device takes over both the display value and the analogue input value.</p>
	Setting the start/offset value of the measuring range, <i>OFFS</i>: Default: 0
	<p>Enter the start/offset value from the smallest to the highest digit [▲] [▼] and confirm each digit with [P]. After the last digit the display switches back to the menu level. If <i>SEMS.F</i> was selected as the input option, you can only select between <i>NOCA</i> and <i>CAL</i>. With <i>NOCA</i>, only the previously set display value is taken over, and with <i>CAL</i>, the device takes over both the display value and the analogue input value.</p>
	Setting the decimal point, <i>DOT</i>: Default: 0
	<p>The decimal point on the display can be moved with [▲] [▼] and confirmed with [P]. The display then switches back to the menu level again.</p>
	Setting up the display time, <i>SEC</i>: Default: 1.0
	<p>The display time is set with [▲] [▼]. The display moves up in increments of 0.1 sec up to 1 sec and in increments of 1.0 sec up to 10.0 sec. Confirm the selection by pressing the [P] button. The display then switches back to the menu level again.</p>
	Rescaling the measuring input values, <i>ENDR</i>: Default: 10000
	<p>With this function, you can rescale the input value of e.g. 8.000 Hz (works setting) without applying a measuring signal. If sensor calibration has been selected, these parameters are not available.</p>

Menu level	Parameterisation level
	<p>Rescaling the measuring input values, <i>OFFSR</i>: Default: 0</p> <p>OFFSR P 8 P 8 P 8 P 8 P 8 P</p> <p>With this function, you can rescale the input value of e.g. 100 Hz (works setting) without applying a measuring signal. If sensor calibration has been selected, these parameters are not available.</p>
	<p>Setting of the pulse delay, <i>DELAY</i>: Default: 0</p> <p>DELAY P 0 250 P</p> <p>With the impulse delay of 0–250 seconds (max), frequencies can be collected, which are even smaller than by the predetermined measuring time of the device. If e.g. a delay of 250 seconds is set, this means that the device waits up to 250 seconds for an edge, before it assumes a 0-Hz-frequency. Thus frequencies up to 0.004 Hz can be collected.</p>
	<p>Adjustment of the optimum digital frequency filter, <i>FLFRQ</i>: Default: NO</p> <p>FLFRQ P NO 100 50 20 10 5 2 P</p> <p>If the optional filter is not activated by the adjustment „NO“, frequencies are ignored by the adjusted frequency filter. Act on the assumption that the pulse-duty factor is 1:1. Accordingly the minimal pulse duration is derived from the half of the time of oscillation. Use a filter of 10 Hz or 20 Hz for contact bounce suppression.</p>
	<p>Selection of analog output, <i>OUT.RA</i>: Default: 4-20</p> <p>OUT.RA P 0-10 0-20 4-20 P</p> <p>Three output signals are available: 0-10 VDC, 0-20 mA and 4-20 mA, with this function, the demanded signal is selected.</p>
	<p>Setting up the final value of the analog output, <i>OUT.EN</i>: Default: 10000</p> <p>OUT.EN P 8 P 8 P 8 P 8 P 8 P</p> <p>The final value is adjusted from the smallest digit to the highest digit with [▲] [▼] and digit by digit confirmed with [P]. A minus sign can only be parameterised on the leftmost digit. After the last digit, the device changes back into menu level.</p>

Menu level	Parameterisation level
	Setting up the initial value of the analog output, OUT.OF: Default: 00000 <p>The final value is adjusted from the smallest digit to the highest digit with [▲] [▼] and digit by digit confirmed with [P]. A minus sign can only be parametrised on the leftmost digit. After the last digit, the device changes back into menu level.</p>
	Threshold values / limit values, LI-1: Default: 2000 <p>For both limit values, two different values can be parameterized. With this, the parameters for each limit value are called up one after another.</p>
	Hysteresis for limit values, HY-1: Default: 00000 <p>For all limit values exists a hysteresis function, that reacts according to the settings (threshold exceedance / threshold undercut).</p>
	Function if display falls below / exceeds limit value, FU-1: Default: HIGH <p>The limit value undercut can be selected with LOW (LOW = lower limit value) and limit value exceedance can be selected with HIGH (HIGH = upper limit value). If e.g. limit value 1 is on a switching threshold of 100 and occupied with function „HIGH“, the alarm will be activated by reaching the threshold. If the limit value is allocated to „LOW“, an alarm will be activated by undercut of the threshold. See page 29.</p>
	Threshold values / Limits, LI-2: Default: 3000 <p>This value defines the threshold, that activates/deactivates an alarm.</p>
	Hysteresis for limit values, HY-2: Default: 00000 <p>The delayed reaction of the alarm is the difference to the threshold value, which is defined by the hysteresis.</p>

Menu level	Parameterisation level
	<p>Function for threshold value undercut /exceedance, FU-2: Default: <i>HIGH</i></p> <p></p> <p>A limit value undercut is selected with <i>LOW</i> (for LOW = lower limit value), a limit value exceedance with <i>HIGH</i> (for HIGH = higher limit value). If e.g. limit value 1 is on a threshold level of 100 and allocated with function <i>HIGH</i>, an alarm is activated by reaching of the threshold level. If the threshold value was allocated to <i>LOW</i>, an alarm will be activated by undercutting the threshold value, as long as the hysteresis is zero.</p>
	<p>User code (4-digit number-combination, free available), U.CODE: Default: <i>0000</i></p> <p></p> <p>If this code is set (>0000), all parameters are locked, if <i>LOC</i> has been selected before under menu item <i>RUN</i>. By pushing [P] during operation mode for approx. 3 seconds, <i>CODE</i> appears in the display. To get to the unlocked reduced parameter, the user needs to enter the preset <i>U.CODE</i>. This code has to be entered before each parameterisation, until the <i>R.CODE</i> (Master code) unlocks all parameters again.</p>
	<p>Master code (4-digit number-combination free available), R.CODE: Default: <i>1234</i></p> <p></p> <p>With this code, all parameters can be released, if <i>LOC</i> has been activated before under menu item <i>RUN</i>. By pushing [P] during operation mode for approx. 3 seconds, <i>CODE</i> appears in the display. The user can now reach all parameters by entering <i>R.CODE</i>. Leaving the parameterisation, under menu item <i>RUN</i>, the user can unlock them permanently by choosing <i>ULOC</i> or <i>PROF</i>. So, there is no need for anew code entering, even by pushing [P] during operation mode again.</p>

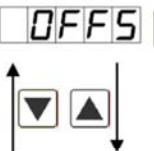

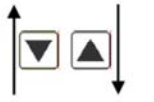

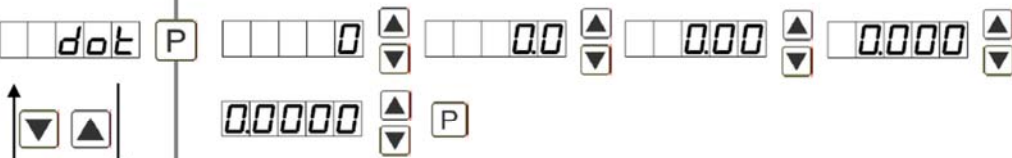

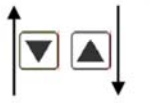

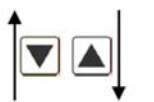

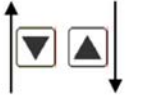

9.3 Programming interlock RUN

	<p>Activation / deactivation of the programming lock or completion of the standard parameterisation with change into menu group level (complete function range), RUN: Default: <i>ULOC</i></p> <p></p> <p>With the navigation keys [▲] [▼], choose between the deactivated key lock <i>ULOC</i> (works setting) and the activated key lock <i>LOC</i>, or the menu group level <i>PROF</i>. Confirm the selection with [P]. After this, the display confirms the settings with "- - - -", and automatically switches to operating mode. If <i>LOC</i> was selected, the keyboard is locked. To get back into the menu level, press [P] for 3 seconds in operating mode. Now enter the <i>CODE</i> (works setting 1 2 3 4) that appears using [▲] [▼] plus [P] to unlock the keyboard. <i>FAIL</i> appears if the input is wrong.</p> <p>To parameterise further functions <i>PROF</i> needs to be set. The device confirms this setting with "- - - -", and changes automatically in operation mode. By pressing [P] for approx. 3 seconds in operation mode, the first menu group <i>INP</i> is shown in the display and thus confirms the change into the extended parameterisation. It stays activated as long as <i>ULOC</i> is entered in menu group <i>RUN</i>, thus the display is set back in standard parameterisation again.</p>
---	---

9.4 Extended parameterisation (Professional operation level)

9.4.1 Signal input parameters

Menu group level	
	Menu level
Menu level	Parameterisation level
	<p>Selection of the input signal, <i>TYPE</i>: Default: <i>FREQU</i></p> <p><i>TYPE</i> P <i>SENS</i> <i>FREQU</i> P</p> <p>If the scaling of the device is done via <i>SENS.F</i> (Sensor calibration), the frequency range needs to be preset under <i>RANGE</i> and is adjusted by application of the final value/initial value. If <i>FREQU</i> (Factory calibration) is preferred, the final value needs to be entered under <i>END</i> and the final frequency needs to be entered under <i>ENDR</i>. Under <i>OFFS</i> the initial value needs to be entered and under <i>OFFSA</i> the initial frequency. There is no application of the measuring signal. Confirm the selection with [P] and the display switches back to menu level.</p>
	<p>Adjustment of pulses per rotation, <i>PPR</i>: Default: 1</p> <p><i>PPR</i> P 8 P 8 P 8 P 8 P 8 P</p> <p>This parameter is only important if <i>TYPE</i> = <i>ROTAR</i> or = <i>POSIT</i> have been selected. Generally it shows the number of pulses per rotation.</p>
	<p>Setting the end value of the measuring range, <i>END</i>: Default: <i>100E3</i></p> <p><i>RANGE</i> P 100E3 9.9999 Hz 100E3 99.999 Hz 100E3 999.99 Hz 100E3 9.9999 kHz 100E3 99.999 kHz 100E3 999.99 kHz P</p> <p>Choose between six different frequency ranges. Confirm the selection with [P] and the display switches back to menu level.</p>
	<p>Setting the final value of the measuring range, <i>END</i>: Default: <i>10000</i></p> <p><i>End</i> P 8 P 8 P 8 P 8 P 8 P <i>NOCA</i> P <i>CAL</i> P</p> <p>Set the final value from the smallest to the highest digit with [▲] [▼] and confirm each digit with [P]. A minus sign can only be parameterized on the leftmost digit. After the last digit, the display switches back to the menu level. If <i>SENS</i> was selected as input option, you can only select between <i>NOCA</i> and <i>CAL</i>. With <i>NOCA</i>, only the previously set display value is taken over, and with <i>CAL</i>, the device takes over both the display value and the analogue input value.</p>

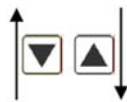

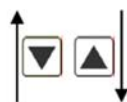

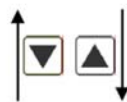

Menu level	Parameterisation level
	<p>Setting the start/offset value of the measuring range, <i>OFFS</i>: Default: 0</p>  <p>Enter the start/offset value from the smallest to the highest digit [▲] [▼] and confirm each digit with [P]. After the last digit the display switches back to the menu level. If <i>SENS.F</i> was selected as the input option, you can only select between <i>NOCA</i> and <i>CAL</i>. With <i>NOCA</i>, only the previously set display value is taken over, and with <i>CAL</i>, the device takes over both the display value and the analogue input value.</p>
	<p>Setting the decimal point, <i>DOT</i>: Default: 0</p>  <p>The decimal point on the display can be moved with [▲] [▼] and confirmed with [P]. The display then switches back to the menu level again.</p>
	<p>Setting up the display time, <i>SEC</i>: Default: 1.0</p>  <p>The display time is set with [▲] [▼]. The display moves up in increments of 0.1 to 1 second and in increments of 1.0 to 10.0 seconds. Confirm the selection by pressing the [P] button. The display then switches back to the menu level again.</p>
	<p>Rescaling the measuring input values, <i>ENDR</i>: Default: 10000</p>  <p>With this function, you can rescale the input value of e.g. 8.000 Hz (works setting) without applying a measuring signal. If sensor calibration has been selected, these parameters are not available.</p>
	<p>Rescaling the measuring input values, <i>OFFA</i>: Default: 0</p>  <p>With this function, you can rescale the input value of e.g. 100 Hz (works setting) without applying a measuring signal. If sensor calibration has been selected, these parameters are not available.</p>

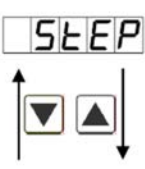

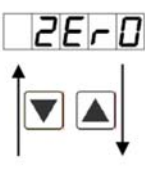

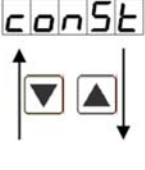

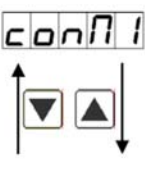

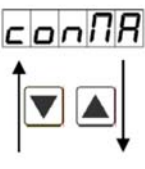

Menu level	Parameterisation level
 DELAY P	Setting up the pulse delay, DELAY: Default: 0  With the pulse delay of 0–250 seconds (max), frequencies can be collected, which are even smaller than by the predetermined measuring time of the device. If e.g. a delay of 250 seconds is set, this means that the device waits up to 250 seconds for an edge, before it assumes a 0-Hz-frequency. Thus frequencies up to 0.004 Hz can be collected.
 FIFRQ P	Adjustment of the optimum digital frequency filter, FIFRQ: Default: NO  If the optional filter is not activated by the adjustment „NO“, frequencies are ignored by the adjusted frequency filter. Act on the assumption that the pulse-duty factor is 1:1. Accordingly the minimal pulse duration is derived from the half of the time of oscillation. Use a filter of 10 Hz or 20 Hz for contact bounce suppression.
 FIRAT P	Adjustment of the pulse-duty factor at activated digital filter, FIRAT: Default: 1  Adjustment of the desired pulse-duty factor for pulse duration and pulse interruption. Like this, a special pulse behaviour can be adjusted.
 TARA P	Setting up the tare/offset value, TARA: Default: 0  The given value is added to the linearized value. In this way, the characteristic line can be shifted by the selected amount.
 SPCT P	Number of additional switching points, SPCT: Default: 00  30 additional switching points can be defined to the initial value and final value, so linear sensor values are not linearised. Only activated setpoint parameters are displayed.

AG-M3F K07/0623 page

9.4.2 General device parameters

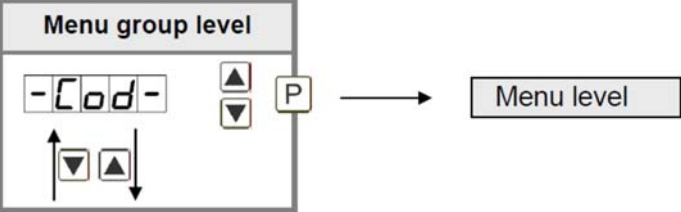

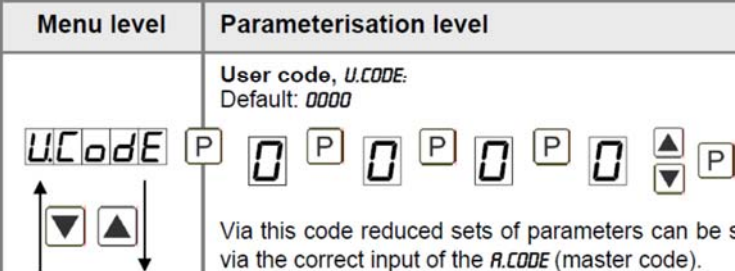

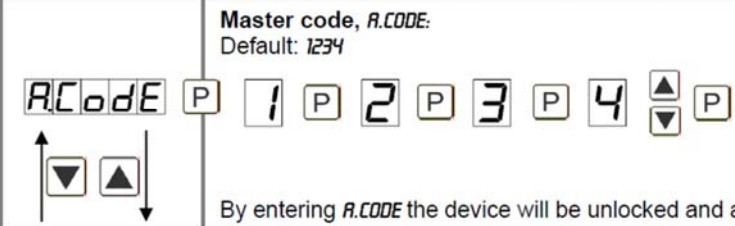

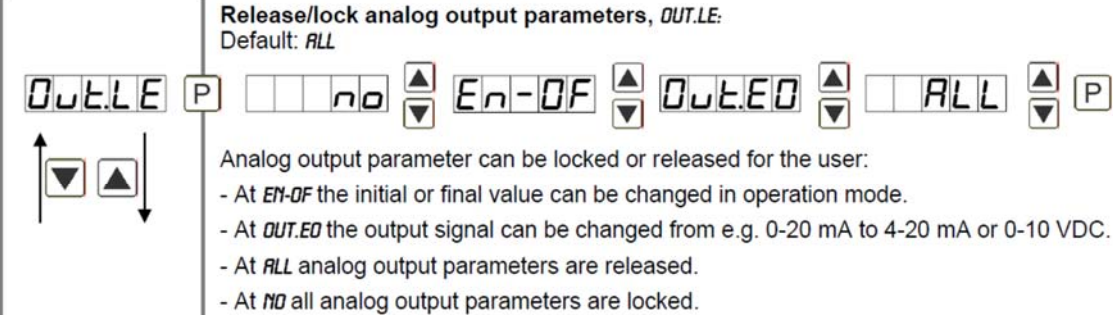

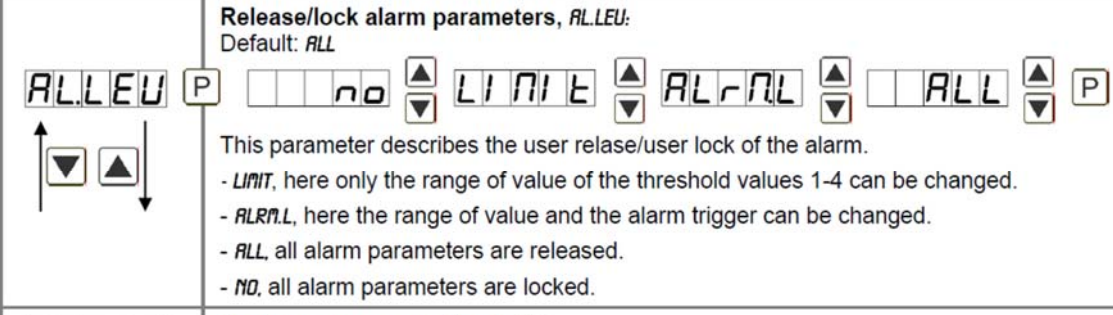

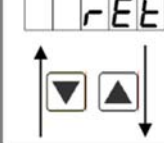

Menu level	Parameterisation level
	<p>Display time, <i>DISC</i>: Default: 01.0</p> <p>      then       </p> <p>The display is set up with  . Thereby on switches until 1 second in 0.1 steps and until 10.0 seconds in 1.0-steps. With  the selection is confirmed and the device changes into menu level.</p>
	<p>Rounding of display values, <i>ROUND</i>: Default: 00001</p> <p>              </p> <p>This function is for instable display values, where the display value is changed in increments of 1, 5, 10 or 50. This does not affect the resolution of the optional outputs. With  the selection is confirmed and the device changes into menu level.</p>
	<p>Arithmetic, <i>ARITH</i>: Default: <i>NO</i></p> <p>              </p> <p>Reciprocal Root extraction Square</p> <p>With this function the calculated value, not the measuring value, is shown in the display. With <i>NO</i>, no calculation is deposited. With  the selection is confirmed and the device changes into menu level.</p>
	<p>Sliding average determination, <i>AVG</i>: Default: 10</p> <p>        </p> <p>Here, the number of the meterings that need to be averaged is preset. The time of averaging results of the product of measuring time <i>SEC</i> and the averaged metering <i>AVG</i>. With the selection of <i>AVG</i> in the menu level <i>DISPL</i>, the result will be shown in the display and evaluated via the alarms.</p>

Menu level	Parameterisation level
	<p>Dynamic for the sliding average determination, STEP: Default: <i>NO</i></p> <p></p> <p>With STEP the sliding average determination can be adjusted dynamically. If 6PRo or 12PRo was selected, a frequency value with a variance of 6% or 12% of the current display value is taken over directly for the sliding averaging. The display appears to be more dynamic at a fast frequency change, without appearing disturbed by a slightly unsteady frequency.</p>
	<p>Zero point slowdown, ZERO: Default: <i>00</i></p> <p></p> <p>At the zero point slowdown, a value range around the zero point can be preset, so the display shows a zero. If e.g. a 10 is set, the display would show a zero in the value range from -10 to +10; below continue with -11 and beyond with +11.</p>
	<p>Definite constant value, CONST: Default: <i>0</i></p> <p></p> <p>The constant value can be evaluated via the alarms or via the analog output, like the current measurand. The decimal place cannot be changed for this value and is taken over by the current measurand. Like this a setpoint generator can be realised via the analog output by this value. Furthermore it can be used for calculating the difference. At this the constant value is subtracted from the current measurand and the difference is evaluated in the alerting or by the analog output. Thus regulations can be displayed quite easily.</p>
	<p>Minimum constant value, CONMI: Default: <i>-9999</i></p> <p></p> <p>The minimum constant value is adjusted from the smallest to the highest digit with the navigation keys [▲] [▼] and confirmed digit per digit with [P]. A minus sign can only be adjusted on the leftmost digit. After the last digit the display changes back into menu level.</p>
	<p>Maximum constant value, CONMA: Default: <i>99999</i></p> <p></p> <p>The maximum constant value is adjusted from the smallest to the highest digit with the navigation keys [▲] [▼] and confirmed digit per digit with [P]. A minus sign can only be adjusted on the leftmost digit. After the last digit the display changes back into menu level.</p>

Menu level	Parameterisation level
<div> <div>DISPL</div> <div>P</div> <div> <div>▲</div> <div>▼</div> </div> </div>	<p>Display, <i>DISPL</i>: Default: <i>ACTUA</i></p> <div> <div>ACTUA</div> <div>MINUA</div> <div>MAXUA</div> <div>TOTAL</div> <div>HOLD</div> <div>AUG</div> <div>CONST</div> <div>DIFF</div> <div>P</div> </div> <p>With this function the current measurand, min/max value, totaliser value, the process-controlled Hold-value, the sliding average value, the constant value or the difference between constant value and current value can be allocated to the display. With [P] the selection is confirmed and the device changes into menu level.</p>
<div> <div>LIGHT</div> <div>P</div> <div> <div>▲</div> <div>▼</div> </div> </div>	<p>Brightness control, <i>LIGHT</i>: Default: 15</p> <div> <div>00</div> <div>15</div> <div>P</div> </div> <p>The brightness of the display can be adjusted in 16 levels from 00 = very dark to 15 = very bright via this parameter or alternatively via the navigation keys from the outside. During the start of the device the level that is deposited under this parameter will always be used, even though the brightness has been changed via the navigation keys in the meantime.</p>
<div> <div>FLASH</div> <div>P</div> <div> <div>▲</div> <div>▼</div> </div> </div>	<p>Display flashing, <i>FLASH</i>: Default: <i>NO</i></p> <div> <div>no</div> <div>AL-1</div> <div>AL-2</div> <div>AL12</div> <div>AL-3</div> <div>AL-4</div> <div>AL34</div> <div>ALAL</div> <div>P</div> </div> <p>A display flashing can be added as additional alarm function either to single or to a combination of off-limit condition. With <i>NO</i>, no flashing is allocated.</p>
<div> <div>EASE</div> <div>P</div> <div> <div>▲</div> <div>▼</div> </div> </div>	<p>Assignment (deposit) of key functions, <i>TAST</i>: Default: <i>NO</i></p> <div> <div>EHTER</div> <div>LI12</div> <div>LI34</div> <div>TARA</div> <div>SETER</div> <div>TOTAL</div> <div>TOTRE</div> <div>EHTERE</div> <div>ACTUA</div> <div>LIGHT</div> <div>no</div> <div>P</div> </div> <p>For the operation mode, special functions can be deposited on the navigation keys [▲] [▼], in particular this function is made for devices in housing size 48x24mm which do not have a 4th key ([O]-key). If the min/max-memory is activated with <i>EHTER</i>, all measured min/max-values are saved during operation and can be recalled via the navigation keys. The values get lost by restart of the device. If the threshold value correction <i>LI12</i> or <i>LI34</i> is chosen, the values of the threshold can be changed during operation without disturbing the operating procedure. With <i>TARA</i> the device is tared to zero and saved permanently as offset. The device confirms the correct taring by showing <i>00000</i> in the display. <i>SETER</i> switches into the offset value and can be changed via the navigation keys [▲] [▼].</p>

Menu level	Parameterisation level
Continuation	Via TOTAL the current value of the totaliser can be displayed for approx. 7 seconds, after this the device changes back on the parameterised display value. If TOT.RE is deposited, the totaliser can be set back by pressing of the navigation keys [▲] [▼], the device acknowledges this with 00000 in the display. The configuration of EHT.RE deletes the min/max-memory. Under ACTUA the measurand is shown for approx. 7 seconds, after this the display returns to the parameterised display value. The brightness can be adjusted with LIGHT . This adjustment is not saved and gets lost at a restart of the device. If NO is selected, the navigation keys are without any function in the operation mode.

9.4.3 Safety parameters

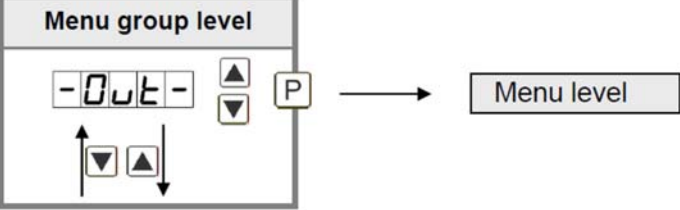

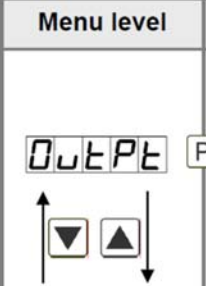

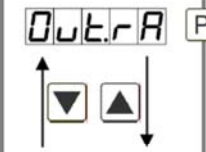

Menu group level	
	
Menu level	Parameterisation level
	User code, U.CODE: Default: 0000 Via this code reduced sets of parameters can be set free. A change of the U.CODE can be done via the correct input of the R.CODE (master code).
	Master code, R.CODE: Default: 1234 By entering R.CODE the device will be unlocked and all parameters are released.
	Release/lock analog output parameters, OUT.LE: Default: ALL Analog output parameter can be locked or released for the user: - At EN-OF the initial or final value can be changed in operation mode. - At OUT.ED the output signal can be changed from e.g. 0-20 mA to 4-20 mA or 0-10 VDC. - At ALL analog output parameters are released. - At NO all analog output parameters are locked.
	Release/lock alarm parameters, AL.LEU: Default: ALL This parameter describes the user release/user lock of the alarm. - LIMIT, here only the range of value of the threshold values 1-4 can be changed. - ALRNL, here the range of value and the alarm trigger can be changed. - ALL, all alarm parameters are released. - NO, all alarm parameters are locked.
	Back to menu group level, RET: With [P] the selection is confirmed and the device changes into menu group level „- COD -“.

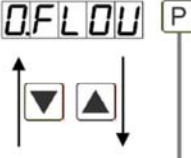

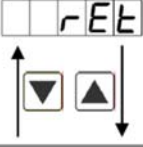

9.4.4 Serial parameters

Menu level	Parameterisation level
	<p>Device address, ADDR: Default: 001</p> <p>The address of the device can be adjusted from the smallest to the highest digit with the up and down keys [▲] [▼] and needs to be approved digit per digit with [P]. An address up to max. 250 is available. Interface data: Baudrate 9600 bit/s, 8 databyte, 1 stopbit, no parity (8n1).</p>
	<p>ModBus operating modes, B.MODE: Default: ASCII</p> <p>There are two different types of operating modes: <i>ASCII</i> and <i>RTU</i>. Modbus transfers no binary cycle, but the <i>ASCII</i>-Code. Thus it is directly readable, however the data throughput is smaller in comparison to the <i>RTU</i>. Modbus <i>RTU</i> (<i>RTU</i> = <i>Remote Terminal Unit</i>) transfers the data in binary-coded. This leads to a good data troughput, even though the data cannot be evaluated directly, as they first need to be transferred into a readable format.</p>
	<p>Timeout, T.OUT: Default: 000</p> <p>The monitoring of the data transfer is parameterised in seconds, up to maximum 100 seconds. By entering 000, no monitoring takes place. The timeout can be adjusted vom the smallest to the highest digit with the up and down keys [▲] [▼] and needs to be approved digit per digit with [P]. After the last digit, the display changes back into menu level.</p>
	<p>Back to menu group level, RET:</p> <p>With [P] the selection is confirmed and the device changes into menu group level „- SER -“.</p>

9.4.5 Analog output parameters

Menu group level	
	Menu level
Menu level	Parameterisation level
	<p>Selection reference of analog output, <i>OUTPT</i>: Default: <i>ACTUA</i></p> <p>  </p> <p>The analog output signal can refer to different functions, in detail these are the current measurand, the min-value, the max-value, the totaliser-/sum function, the constant value or the difference between current measurand and constant value. If <i>HOLD</i> is selected, the signal of the analog output will be kept. It can be continued processing after a deactivation of <i>HOLD</i>. With [P] the selection is confirmed and the device changes into menu level.</p>
	<p>Selection analog output, <i>OUT.rA</i>: Default: <i>4-20</i></p> <p>  </p> <p>Three output signals are available 0-10 VDC, 0-20 mA and 4-20 mA. Select the desired signal with this function.</p>
	<p>Setting the final value of the analog output, <i>OUT.EN</i>: Default: <i>10000</i></p> <p>  </p> <p>The final value is adjusted from the smallest to the highest digit with [▲] [▼] and confirmed digit per digit with [P]. A minus sign can only be parameterised on the leftmost digit. After the last digit the device changes back into menu level.</p>
	<p>Setting the initial value of the analog output, <i>OUT.OF</i>: Default: <i>00000</i></p> <p>  </p> <p>The initial value is adjusted from the smallest to the highest digit with [▲] [▼] and confirmed digit per digit with [P]. A minus sign can only be parameterised on the leftmost digit. After the last digit the device changes back into menu level.</p>

Menu level	Parameterisation level
	<p>Overflow behaviour, O.FLOU: Default: <i>EDGE</i></p> <p>  </p> <p>To recognise and evaluate faulty signals, e.g. by a controller, the overflow behaviour of the analog output can be defined. As overflow can be seen either <i>EDGE</i>, that means the analog output runs on the adjusted limits e.g. 4 and 20 mA, or <i>TO.OFF</i> (input value smaller than initial value, analog output switches on e.g. 4 mA), <i>TO.END</i> (higher than final value, analog output switches on e.g. 20 mA). If <i>TO.MIN</i> or <i>TO.MAX</i> is set, the analog output switches on the smallest or highest possible binary value. This means that values of e.g. 0 mA, 0 VDC or values higher than 20 mA or 10 VDC can be reached. With [P] the selection is confirmed and the device changes into menu level.</p>
	<p>Back to menu group level, RET:</p> <p>With [P] the selection is confirmed and the device changes into menu group level „- OUT -“.</p>

Menu level	Parameterisation level
	Alarms for relay 2, CON-2: Default: <i>R. 2</i>  <p>The allocation of the alarms for relay 2 happens via this parameter, one alarm or a group of alarms can be chosen. With [P] the selection is confirmed and the device changes into menu level.</p>
	Back to menu group level, rEt: <p>With [P] the selection is confirmed and the device changes into menu group level „- REL -“.</p>

9.4.7 Alarm parameters

Menu level	Parameterisation level
	Dependency alarm 1, ALARM.1: Default: <i>ACTUA</i>  <p>The dependency of <i>ALARM.1</i> can be related to special functions, in detail these are the current measurand, the min-value, the Max-value, the totaliser-/sum-value, the constant value or the difference between the current measurand and the constant value. Is <i>HOLD</i> selected, then the alarm is hold and processed just after deactivation of <i>HOLD</i>. <i>EHTER</i> causes the dependency either by pressing the [O]-key on the front of the housing or by an external signal via the digital input. With [P] the selection is confirmed and the device changes into menu level.</p> <p>Example: By using the maximum value <i>ALARM.1 = MAX.VA</i> in combination with a threshold monitoring <i>FU-1 = HIGH</i>, an alarm confirmation can be realised. Use the navigation keys, the fourth key or the digital input for confirmation.</p>

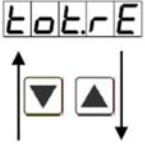

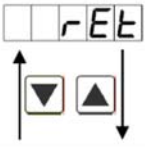

Menu level	Parameterisation level
	Threshold values / limit values, LI-1: Default: 2000  <p>For both limit values, two different values can be parameterized. With this, the parameters for each limit value are called up one after another.</p>
	Hysteresis for limit values, HY-1: Default: 00000  <p>For all limit values exists a hysteresis function, that reacts according to the settings (threshold exceedance / threshold undercut).</p>
	Function if display falls below / exceeds limit value, FU-1: Default: HIGH  <p>The limit value undercut can be selected with LOW (LOW = lower limit value) and limit value exceedance can be selected with HIGH (HIGH = upper limit value). If e.g. limit value 1 is on a switching threshold of 100 and occupied with function „HIGH“, the alarm will be activated by reaching the threshold. If the limit value is allocated to „LOW“, an alarm will be activated by undercut of the threshold.</p>
	Switching-on delay, TON-1: Default: 000  <p>Preset a delayed switching-on of 0-100 seconds, for limit value 1.</p>
	Switching-off delay, TOF-1: Default: 000  <p>Preset a delayed switching-off of 0-100 seconds, for limit value 1.</p>
	Back to menu group level, RET: <p>With [P] the selection is confirmed and the device changes into menu group level „- AL1 -“.</p>

The same applies to -AL2- to -AL4-.

9.4.8 Totaliser (Volume measurement)

Menu level	Parameterisation level
	Totaliser state, <i>TOTAL</i>: Default: <i>OFF</i> <p>The totaliser makes it possible to do measurements on a time base of e.g. l/h, at this the scaled input signal is integrated by a time and steadily (select <i>STEAD</i>) or temporarily (select <i>TEMP</i>) saved. If <i>OFF</i> is selected, the function is deactivated. With [P] the selection is confirmed and the device changes into menu level.</p>
	Time base, <i>T.BASE</i>: Default: <i>SEC</i> <p>Under this parameter the time base of the measurement can be preset in seconds, minutes or hours.</p>
	Totaliser factor, <i>FACTO</i>: Default: <i>10⁰0</i> <p>At this the factor ($10^0 \dots 10^6$) respectively the divisor for the internal calculation of the measuring value is assigned.</p>
	Setting up the decimal point for the totaliser, <i>TOT.DT</i>: Default: <i>0</i> <p>The decimal point of the device can be adjusted with the navigation keys [▲] [▼]. With [P] the selection is confirmed and the device changes into menu level.</p>

Menu level	Parameterisation level
	<p>Totaliser reset, <i>TOT.RE</i>: Default: 00000</p>  <p>The reset value is adjusted from the smallest to the highest digit with the navigation keys [▲] [▼] and digit per digit confirmed with [P]. After the last digit, the display switches back to the menu level. The activator for the reset is parameter driven via the 4th key or via the optional digital input.</p>
	<p>Back to menu group level, <i>RET</i>:</p> <p>With [P] the selection is confirmed and the device changes into menu group level „- TOT -“.</p>

Programming lock, *RUN*:

Description see page 14, menu level RUN

10. Reset to factory settings

To return the unit to a **defined basic state**, a reset can be carried out to the default values. The following procedure should be used:

- Switch off the power supply
- Press button **[P]**
- Switch on voltage supply and press **[P]**-button until „- - - -“ is shown in the display.

With reset, the default values of the program table are loaded and used for subsequent operation. This puts the unit back to the state in which it was supplied.

Caution! All application-related data are lost

11. Alarms/Relays

This device has 4 virtual alarms that can monitor one limit value in regard of an undercut or exceedance. Each alarm can be allocated to an optional relay output S1-S2; furthermore, alarms can be controlled by events like e.g. Hold value or min/max-value.

Function principle of alarms / relays	
Alarm / Relay x	Deactivated, instantaneous value, min/max-value, Hold-value, totaliser value, sliding average value, constant value, difference between instantaneous value and constant value or an activation via the digital input or via the [O] -key.
Switching threshold	Threshold / limit value of the change-over.
Hysteresis	Broadness of the window between the switching thresholds
Working principle	Operating current / Quiescent current.

Operating current

By operating current the alarm S1-S2 is off below the threshold and on on reaching the threshold.

Quiescent current

By quiescent current the alarm S1-S2 is on below the threshold and switched off on reaching the threshold.

Switching-on delay

The switching-on delay is activated via an alarm and e.g. switched 10 seconds after reaching the switching threshold, a short-term exceedance of the switching value does not cause an alarm, respectively does not cause a switching operation of the relay. The switching-off delay operates in the same way, keeps the alarm / the relay switched longer for the parametrised time.

12. Interfaces RS232 and RS485

Connection RS232

Connection RS485

The interface **RS485** is connected via a screened data line with twisted wires (Twisted-Pair). On each end of the bus segment a termination of the bus lines needs to be connected. This is necessary to ensure a secure data transfer to the bus. For this a resistance (120 Ohm) is interposed between the lines Data B (+) and Data A (-).

13. Programmer examples

Example for the rotation speed adjustment:

In this application the rotation speed of an axis shall be collected via a toothed wheel with 30 sprockets, per Namur sensor. It is then displayed with one position after decimal point and the dimension rpm.

Parameter	Settings	Description
<input type="text" value="TYPE"/>	<input type="text" value="rotAr"/>	Rotation – rotation speed measurement up to 10 kHz
<input type="text" value="PPr"/>	<input type="text" value="30"/>	Number of sprockets
<input type="text" value="dot"/>	<input type="text" value="00"/>	1 position after decimal point

Advice: The input frequency may be maximum 9.999 kHz in this operating module. So, a rotation speed parameterisation via the frequency adjustment is rarely necessary.

Example for the position coverage:

A measuring system for length works via an incremental encoder with two dephased output signals (typically A and B) and 100 pulse/rotation. The axis perimeter was calculated in a way that the measuring section can be extracted by a rotation of 6 cm = 60 mm. The display shall show the relative position in millimeter. There is a zero point position with a limit switch, that can zero the display if required.

Parameter	Settings	Description
<input type="text" value="TYPE"/>	<input type="text" value="PosIt"/>	Positioning – rotary encoder
<input type="text" value="PPr"/>	<input type="text" value="100"/>	Pulse number per rotation
<input type="text" value="End"/>	<input type="text" value="60"/>	Change of length per rotation
<input type="text" value="dig.in"/>	<input type="text" value="tArR"/>	Display zero

Advice: The display starts always on position zero. The parameter **dig.in** can be found under parameter group **-fct-** in the extended parameterisation **Prof**.

DAG-M3F

Example for angle coverage:

On a manually operated bender for sheet metal the bending angle shall be displayed in degree. The device is in zero state (0°) during switching on of the display. An incremental encoder with 360 pulses/rotation is used

Parameter	Settings	Description
TYPE	PosIt	Positioning – rotary encoder
PPR	360	Pulse number per rotation
End	360	Angle sum per rotation

Examples: Adjustment according to number of sprockets at unknown rotation speed.

nearly 100% of the rotation speeds are in the range of 0 to 30.000 r.p.m.
the number of sprockets varies (without gearing) between 1 and 100
in automation, the frequency supply never exceeds 10 kHz (rather 3 kHz)

Assume a rotation speed of 60 r.p.m. at 1 Hz, whereat the real frequency value will not be considered.

Our example complies with a number of sprockets of 64.

Setting up the advice

Based on the default settings of the display, the following parameters need to be changed:

Parameter	Settings	Description
TYPE	FREQU	Applying of the measuring signal is not applicable.
RANGE	1E3	Complies with 9.9999 Hz
End	6	Assumed final value
EndA	0.0064	Complies with 64 sprockets

If the frequency needs to be displayed with a position after decimal point, then a 60 has to be selected as final value for this adjustment.

Parameter	Settings	Description
TYPE	FREQU	Applying of the measuring signal is not applicable.
RANGE	1E3	Complies with 9.9999 Hz
End	60	Assumed final value
dot	00	1 position after decimal point
EndA	0.0064	Complies with 64 sprockets

Example: Rotation speed of a machine shaft

There are 4 sprockets on one machine shaft. Applied in an angle of 90° to each other and to the rotation speed measurement. The sprockets are collected via a proximity switch and evaluated by the frequency device, which shall display the rotation speed in U/min.

0...3600 U/min is preset as rotation speed range of the machine.

Calculation of the input frequency

Number of sprockets = 4
Rotation speed = 3600 U/min

$$\text{Final frequency [Hz]} = \frac{\text{Final rotation speed } \left[\frac{\text{U}}{\text{min}} \right]}{60 \left[\frac{\text{s}}{\text{min}} \right] \times 1 \text{U}} \times \text{Number of sprockets}$$

$$\text{Final frequency [Hz]} = \frac{3600 \frac{\text{U}}{\text{min}}}{60 \frac{\text{s}}{\text{min}} \times 1 \text{U}} \times 4 = 240 \text{ Hz}$$

Setting up the device

Based on the default settings of the device, following parameters need to be changed:

Parameter	Settings	Description
<input type="checkbox"/> TYPE	FREQU	As the input frequency is known, the device does not need to be applied to the measuring section.
<input type="checkbox"/> RANGE	100E0	The final frequency is in the range of 100.00 to 999.99 Hz.
<input type="checkbox"/> End	3600	A rotation speed of 3600 shall be displayed as final value.
<input type="checkbox"/> EndR	240.00	The final frequency for display value 3600 is 24.00 Hz.

16. Dimensions

Operating instructions, data sheet, approvals and further information via the QR code on the device or via www.kobold.com

17. Safety advices

Please read the following safety advice and the assembly *chapter 6* before installation and keep it for future reference.

Proper use

The **DAG-device** is designed for the evaluation and display of sensor signals.

Danger! Careless use or improper operation can result in personal injury and/or damage the equipment.

Control of the device

The panel meters are checked before dispatch and sent out in perfect condition. Should there be any visible damage, we recommend close examination of the packaging. Please inform the supplier immediately of any damage.

Installation

The **DAG-device** must be installed by a suitably **qualified specialist** (e.g. with a qualification in industrial electronics).

Notes on installation

There must be no magnetic or electric fields in the vicinity of the device, e.g. due to transformers, mobile phones or electrostatic discharge.

The **fuse rating** of the supply voltage should not exceed a value of **0.5 A N.B. fuse**. Do not install **inductive consumers** (relays, solenoid valves etc.) near the device and **suppress**

any interference with the aid of RC spark extinguishing combinations or free-wheeling diodes.

Keep input, output and supply lines separate from one another and do not lay them parallel with each other. Position “go” and “return lines” next to one another. Where possible use twisted pair. So, you receive best measuring results.

Screen off and twist sensor lines. Do not lay current-carrying lines in the vicinity. Connect the

screening on one side on a suitable potential equaliser (normally signal ground).

The device is not suitable for installation in areas where there is a risk of explosion. Any electrical connection deviating from the connection diagram can endanger human life and/or can destroy the equipment.

The terminal area of the devices is part of the service. Here electrostatic discharge needs to be avoided. Attention! High voltages can cause dangerous body currents.

Galvanic isolated potentials within one complex need to be placed on a appropriate point (normally earth or machines ground). So, a lower disturbance sensibility against impacted energy can be reached and dangerous potentials, that can occur on long lines or due to faulty wiring, can be avoided.

18. Error elimination

	Error description	Measures
1.	The device shows a permanent overflow 	<ul style="list-style-type: none"> The input frequency is too high for the selected frequency range. Correct „<i>RANGE</i>“ according to this. Disturbing pulses lead to an increased input frequency, activate „<i>FI.FRD</i>“ at smaller frequencies or shield the sensor line. A mechanic switching contact chatters. Activate the frequency filter „<i>FI.FRD</i>“ with 10 or 20 kHz. The display was taught faulty under „<i>TYPE</i>“ = „<i>SENS.F</i>“. Error elimination see below.
2.	The device shows a permanent underflow. 	<ul style="list-style-type: none"> An offset frequency „<i>OFFSA</i>“ bigger than 0 Hz respectively a „Living Zero“ was selected, in which no frequency is aligned. Check the sensor lines or set the „<i>OFFSA</i>“ onto 0 Hz. The display underflow <i>DL.UND</i> was selected too high. The according parameter needs to be adapted. The device was taught faulty under „<i>TYPE</i>“ = „<i>SENS.F</i>“. Error elimination see below.
3.	The displayed values switches sporadical.	<ul style="list-style-type: none"> Disturbances lead to short-term display switches. For smaller frequencies use the frequency filter „<i>FI.FRD</i>“, select a higher measuring time or use the sliding averaging. The sprockets that need to be collected, are not evenly spread on a shaft or are not recorded correctly. Use the sliding averaging „<i>AVG</i>“ if necessary with the dynamic function „<i>STEP</i>“. The displayed value „<i>DISPL</i>“ needs to be set on „<i>AVG</i>“.
4.	The display remains on zero.	<ul style="list-style-type: none"> The sensor was not connected properly. Check the connection lines and if necessary the sensor supply. Best directly on the screw terminals of the device! A PNP- respectively NPN-output does not reach the required threshold. Check the voltage between terminal 2 and 3 with a multimeter. Depending on signal form it generally should be between 4 V and 15 V. The thresholds can be checked more safely with an oscilloscope. If necessary include an external Pull-up or Pull-down. A Namur-sensor does not react. Check the distance between the sensor and the sprocket / survey mark and if necessary measure the voltage between 1 and 3. In open condition the input voltage needs to be smaller than 2.2 V and in active condition bigger than 4.6 V. The selected range of the input frequency is too high. Reduce the frequency range „<i>RANGE</i>“ to a smaller value. The activated frequency filter „<i>FI.FRD</i>“ suppresses the relevant pulses. Increase the filter frequency „<i>FI.FRD</i>“ or use the adaption of the key proportion „<i>FI.RAT</i>“. If this should not work, temporarily deactivate the frequency filter with „<i>FI.FRD</i>“ = „<i>ND</i>“. The device was taught faulty under „<i>TYPE</i>“ = „<i>SENS.F</i>“. Change into „<i>TYPE</i>“ = „<i>FREQU</i>“ and preset the assumed frequency range „<i>RANGE</i>“ and the according initial and final values „<i>END</i>“, „<i>OFFS</i>“, „<i>ENDF</i>“, and „<i>OFFSA</i>“. So you can check if a frequency signal was connected to the input.
5.	The device shows „ <i>HELP</i> “ in the 7-segment display	<ul style="list-style-type: none"> The device located an error in the configuration memory, execute a reset to the default values and set up the device according to your application.
6.	Program numbers for the parameterisation of the input are not available	<ul style="list-style-type: none"> The programming interlock is activated. Enter correct code.
7.	The device shows „ <i>ERR</i> “ in the 7-segment display	<ul style="list-style-type: none"> Contact the manufacturer if errors of this kind occur.
8.	The device does not react as expected.	<ul style="list-style-type: none"> If you are not sure, that the device has been parameterised before, restore the state of delivery as described in <i>chapter 6</i>.

19. Disposal

Note!

- Avoid environmental damage caused by media-contaminated parts
- Dispose of the device and packaging in an environmentally friendly manner
- Comply with applicable national and international disposal regulations and environmental regulations.

Batteries

Batteries containing pollutants are marked with a sign consisting of a crossed-out garbage can and the chemical symbol (Cd, Hg, Li or Pb) of the heavy metal that is decisive for the classification as containing pollutants:

1. „Cd" stands for cadmium
2. „Hg" stands for mercury
3. „Pb" stands for lead
4. „Li" stands for lithium

Electrical and electronic equipment

20. EU Declaration of Conformance

We, KOBOLD Messring GmbH, Hofheim-Ts, Germany, declare under our sole responsibility that the product:

Digital Indicator and Controller

Model: DAG-M3F

to which this declaration relates is in conformity with the standards noted below:

EN 61010-1:2010 + A1:2019 + A1:2019/AC:2019 Safety requirements for electrical equipment for measurement, control and laboratory use - Part 1: General requirements

EN 61326-1:2013 Electrical equipment for measurement, control and laboratory use - EMC requirements - Part 1: General requirements

EN IEC 63000:2018 Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

Also, the following EC guidelines are fulfilled:

2014/30/EU

EMC Directive

2014/35/EU

Low Voltage Directive

2011/65/EU

RoHS (category 9)

2015/863/EU

21. UK Declaration of Conformity

We, KOBOLD Messring GmbH, Hofheim-Ts, Germany, declare under our sole responsibility that the product:

Digital Indicator and Controller

Model: DAG-M3F

to which this declaration relates is in conformity with the standards noted below:

BS EN 61010-1:2010+A1:2019

Safety requirements for electrical equipment for measurement, control, and laboratory use. General requirements

BS EN 61326-1:2013

Electrical equipment for measurement, control and laboratory use. EMC requirements. General requirements

BS EN IEC 63000:2018

Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances.

Also, the following UK guidelines are fulfilled:

S.I. 2016/1091

Electromagnetic Compatibility Regulations 2016

S.I. 2016/1101

Electrical Equipment (Safety) Regulations 2016

S.I. 2012/3032

The Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012

Hofheim, 06 June 2023

22. Appendix MODBUS Device Interface

MODBUS Device Interface for M-Line

interface parameters: 1 Start-, 8 Daten-, 1 Stopbit, no parity, 9600 baud

Compatibility – The interface is compatible with the Modicon Modbus protocol. That is, all the registers have a size of 16-bits. Larger data types are then occupied by several registers in a row. It also supports a non-Modicon compatible mode. In this mode, each data type is only one register corresponding to the data type size (minimum is always 16-bits).

Info: Modicon - company that has produced the first PLC, now Schneider Electric

Note: Access to data types must prove the plurality of registers always be in a read-write and must not be distributed to several write accesses!

Device address: Device address as a value between 1 and 247 can be used. To address 0 multiple devices can simultaneously achieve (broadcast), if the corresponding function is supported (no reception is possible, for example device reset).

Transfer Mode: The devices support the RTU mode (binary data, default) and ASCII mode (alphanumeric characters - hexadecimal). The RTU mode is faster because fewer bytes but must be trans-mitted this critical time. The ASCII mode is more suitable for communication with PC based systems, since they often can not meet the time-critical conditions for the RTU mode.

Note: The device configuration with the PM tool is possible only in ASCII mode.

Supported data types

Name	Number range	Size	Register count Modicon mode	Register count not Modicon mode
INT08	-128..127	2 Byte	1	1
UINT08	0..255	2 Byte	1	1
INT16	-32768..32767	2 Byte	1	1
UINT16	0..65535	2 Byte	1	1
INT32	-2147843648.. 2147843647	4 Byte	2	1
UIN32	0..4294967295	4 Byte	2	1
INT64	-9223372036854775808.. 9223372036854775807	8 Byte	4	1
FLOAT	-/+3.402823466e-/+38	4 Byte	2	1

Adress range

Range hex	dec	Comment
0x0000 .. 0x3FFF	0 .. 16383	Reserved (not Modicon mode)
0x4000 .. 0x4FFF	16383 .. 20497	16-Bit Integer without decimal place
0x5000 .. 0x5FFF	20480 .. 24575	Reserved
0x6000 .. 0x6FFF	24576 .. 28671	32-Bit Integer without decimal place
0x7000 .. 0x7FFF	28672 .. 32767	32-Bit Float
0x8000 .. 0xFFFF	32768 .. 65535	Reserved

Supported function codes

Code (hex)	Function	Comment
0x03	READ HOLDING REGISTERS	For example measuring values or alarms
0x04	READ INPUT REGISTER	Same function like 0x03
0x08	DIAGNOSTIC	Diagnose informations
0x10	WRITE MULTIPLE REGISTERS	For example measuring values or alarms

Register description

Adress range 0x4000 .. 0x4FFF - 16 bit Register					
Name	Index	Access mode	Min/Max- value data type	Comment	
Measuring channel	0x4400	r/w	0..65535 UNIT16	User defined identification	
Alarm status	0x4500	r/w	0..65535 UNIT16	Bit	Funktion
				0	Alarm 1 active
				1	Alarm 2 active
				2	Alarm 3 active
				3	Alarm 4 active
				4	Alarm 5 active
				5	Alarm 6 active
				6	Alarm 7 active
				7	Alarm 8 active
				8..15	Reserved
Relay status	0x4600	r/-	0..65535 UNIT16	Bit	Funktion
				0	Relay 1 active
				1	Relay 2 active
				2	Relay 3 active
				3	Relay 4 active
				4	Relay 5 active
				5	Relay 6 active
				6	Relay 7 active
				7	Relay 8 active
				8..15	reserviert
Display brightness	0x4700	r/w	0..15	0 = dark (lowest level) 15 = bright (highest level)	

Note: 4-digit display is the minimum value and the maximum value -2000 10,000.

The display area is limited to 4-digit displays from -1999 to 9999 and on 5-digit -19999 to 99999. A measured value of -20000 or 100000 (or -2000 to 10000 or 4-digit display) signalisert an underflow or overflow of the measuring range. The same is also valid if on the last digit of the display, a symbol of a unit of measurement is displayed.

Write a 32-Bit Wertes

MODBUS Device address 1, Register index 0x6004, Count of registers 2, value 91696 (0x00016630)

Protokoll: MODBUS-RTU

Request

Address Function		Data									Check sum	
		Startadresse		Anzahl Register		Count Bytes	Low-Word		High-Word			
		High-Byte	Low-Byte	High-Byte	Low-Byte		High-Byte	Low-Byte	High-Byte	Low-Byte	Low-Byte	High-Byte
0x01	0x10	0x60	0x04	0x00	0x02	0x04	0x66	0x30	0x00	0x01	0xnn	0xnn

Response

Address Function		Data				Check sum	
		Start address		Count of registers			
		High-Byte	Low-Byte	High-Byte	Low-Byte	Low-Byte	High-Byte
0x01	0x10	0x60	0x02	0x00	0x02	0xnn	0xnn

Note: Note that the Modicon compatible mode, with the 16-bit value of the register address (index), number of registers and register contents, always the high byte is first passported. In contrast, the low word is transmitted first with 32-bit values. This is handled for the FLOAT data type as.

Error codes

Modbus – The Modbus protocol provides for the transmission of error code in some cases.

Fehlercode	Beschreibung
0x01	Error code is not supported
0x02	Register address or index is not supported
0x03	Data error
0x04	General device error

If the checksum is faulty, the device sends no response to the request. This behavior is to generate a timeout on the opposite side.

Response

Address	Function	Error Number	Check sum	
			Low-Byte	High-Byte
0x01	0x83	0x04	0xnn	0xnn

An error is indicated by a set bit 7 in the function code in the response.

Device diagnostics

Diagnostic functions

Sub function	Data	Comment
0x0000	0x0000	Echo connection test
0x0001	0x0000	Start device initialization
	0x0001	Reset device
0x0002	0x0000	Request diagnostic register (see below)
0x000A	0x0000	Reset all diagnostic registers
0x000B	0x0000	Request count of communications
0x000C	0x0000	Request count of check sum errors
0x000D	0x0000	Request count of request errors
0x000E	0x0000	Request the total count of request messages
0x000F	0x0000	Request the count of broadcast request messages
0x0010	0x0000	like 0x000D
0x0012	0x0000	Request count of check sum overruns
0x0014	0x0000	Reset count of check sum overruns
